内 容 简 介

本书重点对科技资源管理与服务、信息质量与数据治理、语义信息组织与检索进行深入的研究与探讨。内容涉及科技资源开放共享与评价、科技资源增值利用与服务创新、科研项目知识产权管理、科学数据管理开放共享、信息质量管理、科技成果信息开放获取以及语义信息组织与检索的技术与方法等方面。本书力求体现科技资源管理领域的最新研究成果,具有一定的学术性与参考性,适合广大科技资源管理者和研究者阅读。

Preface of COINFO 2013

COINFO conferences have been organized by the Institute of Scientific and Technical Information of China (ISTIC) in collaboration with Chinese and overseas universities and approved by the Ministry of Science and Technology (MOST) of China since 2006. Now in its 8th year, COINFO attracts senior officials and industry leaders as well as experts from Germany, UK, Spain, Belgium, Canada, Australia, USA and China. It has now become a high-end international platform for academic exchanges in information sharing.

This, the 8th International Conference on Cooperation and Promotion of Information Resources in Science and Technology (COINFO 2013) is organized by China's national research agency, the Institute of Scientific and Technical Information of China (ISTIC), in collaboration with Wuhan University and renowned universities and organizations from around the world.

The theme of COINFO 2013 is **Sharing of Information Resources in the Era of Big Data**. Along with the fast development of Internet and Internet of Things (IOT), Big Data technologies are already operating behind the scene delivering benefit to many organizations through massive power for data analysis. The impacts are still unknown, but the capacity to analyze trends including individual consumer behavior are both exciting and daunting. It will be critical to identify and manage issues so that we can enjoy the many benefits of Big Data; issues to be explored include:

- The challenge to management in the era of Big Data
- Social impacts – privacy/security
- How to release results of data analysis that might have impacts on individuals and groups
- How to successfully adopt and how to equip managers to realize the benefits of Big Data

68 papers have been selected from all the submissions, which have been reviewed by at least two reviewers. And the conference research topics have been classified into five general tracks or areas of research as follows:

- (1) Management and service of Sci-Tech Resources
- (2) Information Quality and data governance
- (3) Semantic Information Organization and Retrieval

COINFO'2013 provides a unique forum for engagement around this conference theme, as well as other common interests of the participants, who may have different frames of reference in which to deploy what they learn at the conference. All the international participants of COINFO'2013 would come to share their experiences, benchmark, learn best practices, and find out about emerging trends.

Organizing Committee

Chair

Defang He Institute of Scientific and Technical Information of China, China

Co-Chairs

Jie Peng Institute of Scientific and Technical Information of China, China

Qing Fang Wuhan University, China

Paul F. Uhlig United States National Research Council, USA

Stanley C. Ahalt Renaissance Computing Institute (RENCI), University of North Carolina at Chapel Hill, USA

Director

Xinmin Zhang Institute of Scientific and Technical Information of China, China

Deputy Director

Jie Peng Institute of Scientific and Technical Information of China, China

Gang Li Wuhan University, China

Jeffrey Soar University of Southern Queensland, Australia

Members

Ruhua Huang Wuhan University, China

Wei Zhao Institute of Scientific and Technical Information of China, China

Xincai Wang Wuhan University, China

Baoqiang Qu Institute of Scientific and Technical Information of China, China

Xuemeng Cheng Wuhan University, China

Ying Su Institute of Scientific and Technical Information of China, China

Zhuanghai Shen Wuhan University, China

Contents

Part 1 Management and Service of Sci-Tech Resources

Analysis of Science and Technology Resource as Public Goods.....	Guihong Zhang, Yue Zhu	3
Analysis the National Science Foundation from 2001 to 2012: Taking the Research of “Library and Information Science” Subject as an Example	Rongying Zhao, Junyin Zhao, Wen Chai, et al	9
Cloud Computing Information Service Innovation	Nan Zhan, Huan Su	16
Company Knowledge Creation Mode in Large-scale Public Enterprise	Mei Yu, Bo Luo	24
Comprehensive Assessment and Research of Intellectual Property Right Management Capabilities	Yanqiu Song, Junlin Chen, Zhifeng Wang	30
Cross-system Service Mashup Based on Knowledge Innovation Value Chain	Weiwei Yan, Changping Hu	37
From Distributed to Collaborative: The Organizational Transformation of Chinese Industry Information Services System	Jing Zhang, Changping Hu	44
Government Intellectual Property Rights Management of Strategic Emerging Industries Development	Zhaofeng Chen	50
Information Service Innovation in the Big Data Era	Bin Zhan, Xiang Li, Ma Feicheng	57
On Innovation of Archive Management in Big Data Era	Xincai Wang, Jiayou Ding	66
Relationship of Behavior, Performance and Income of Agricultural Technician: Transformation of Agricultural Technology Achievements in China	Hongfang Shen, Pengsha Pang	73
Research Focuses and Frontiers of Intellectual Property of China	Ning Sun, Ya Chen	82
Research on Scientific and Technical Talents Discovery Based on Large Data	Zhen Peng, Jie Peng, Wei Zhao	87
Research on Supply Chain Management of Food Security Based on Internet	Yu Bai, Changping Hu	91
Research on the Evaluation Index System of High-level Innovative Sci-Tech Talents	Xin Wu	94
Review on Websites and Network Information Resources Evaluation	Xiumei Zhang, Junli Liu	101
Study on the Information Service of Innovative Sci-Tech Resource under the Big Data Background	Shengli Deng, Fei Ling, YouDi Yang	108
Study on Sharing of Scientific and Technological Resources in China	Lihong Tan, Miao Zou	116
Study on the Shared Mental Model of Academic Teams	Chen Bai	121
The Construction and Value-added Service of Nation Achievement of Science and Technology Database	Yanhua Zhu	127
The Evolution of the Research Topics of Chinese Library and Information Science Research Institutions	Lu An, Yucheng Guo	133
The Innovation and Development of Knowledge Service in the Era of Big Data	Shiyin Chen, Xiaoli Wang	139

The Path of Chinese University Patent: A Comparison and Best Model Research	<i>Jingzhu Wei</i>	145
The Study for Network Intellectual Property Management in Research Institutions Based on Sharing	<i>Xueqin Wang, Ya Chen</i>	150
The Study of Excellent National Laboratory's Large-scale Scientific Instrument Information Sharing	<i>Jie Zhang, Cheng Dong</i>	154
User Stickiness Research Based on Social Network Theory in Social Media Environment	<i>Zi Lei</i>	160
User-oriented Cross-system Collaborative Information Services Platform Construction and Customized Service Advance	<i>Changping Hu, Yuan Hu</i>	166

Part 2 Information Quality and Data Governance

A Case Study for Evaluating Data Quality in European Patent Office	<i>Mouzhi Ge</i>	175
Big Data Analytics in Ageing Propulation and Reproductive Health: Science Data Center as an Example	<i>Hua Yu, Weihong Zhang, Ying Su, et al</i>	180
Big Data in the Population and Reproductive Health Science Data Sharing Platform: Accelerating Value and Innovation of Healthcare Research	<i>Jing Dong, Jadad Alex, Huilong Duan, et al</i>	187
Evaluation on Web Accessibility of the Scientific Data Sharing Platforms	<i>Zhifeng Zhou</i>	194
Human-centred eHealth: Current Features and Future Perspectives	<i>Xiaoying Tang, Yuhua Peng, Qing Zhang, et al</i>	199
Identifying and Evaluating the Cost-benefit of Data Curation and Sharing	<i>Li Si, Wenming Xing, Xiaozhe Zhuang, et al</i>	206
Infrastructure, Standards, and Policies for Research Data Management	<i>Jian Qin</i>	214
International Scientific Data Sharing Policies and Regulations System: The Institutional Foundation of Linked Science	<i>Ximing Xiao, Yi Tang, Jing Cao</i>	220
Management for Electronic Resources Metadata	<i>Ying Cheng, Yan Rao, Yaolei Zhang, et al</i>	226
New Development of Scientific Data Analysis Method: Visualization Analysis	<i>Rongying Zhao, Shengnan Wu, Xianqin Zeng</i>	231
Proposing a Framework for the Analysis of Qualitative Research Data	<i>Lihong Zhou</i>	235
Reviews of Data Curation at Home and Abroad	<i>Wenwen Li, Linlin Han, Chengjin Sha, et al</i>	240
Study on Metadata Interoperability Extension of Data Sharing Infrastructure of Earth System Science of China Based on GeoNetwork	<i>Peng Liu, Juanle Wang, Jia Song</i>	246
Telehealth Enhancement of Hospital Outreach for the Aged and Chronic Disease Management: A UTAUT-based Model for Review of Patients Acceptance	<i>Salifu Yusif, Jeffrey Soar</i>	251
The Analysis and Visualization Study on the Big Data Research Papers in China from the Years of 2003 to 2013	<i>Rongying Zhao, Song Wang</i>	256
The Analysis of the First Screen Time for Chinese Scientific Data Sharing Websites	<i>Jidong Jiang, Jie Peng, Hui Zhao, et al</i>	262
The Analysis on Sharing Mode of Scientific Data in the Era of Big Data	<i>Jian'an Zuo</i>	268
The Current Situation of Scientific Metadata	<i>Ruhua Huang, Chunyan Qiu</i>	273

The Developing Process of Open Access Journals and Its Inspiration for China's Social Science Academic Journals.....	<i>Dandan Yang, Jingwen Zhu</i>	280
The Impact of Health Enabling Technologies on the Quality and Safety of Aged Care: A Model for Assessment of eHealth Applications.....	<i>Jeffrey Soar, Kim Fung Tsang, Ying Su, et al</i>	284
The Mechanism of Spontaneous Order in Online Knowledge Sharing Community: Taking Wikipedia as an Example.....	<i>Xiaoyu Li</i>	291
Using Online Linked-data Database to Improve the Work Pattern of a Web2.0 Review Site.....	<i>Ziran Zhang, Wen Zhang, Jinhui Huang</i>	298
What is Public Worry About in Time of Public Emergency: An Empirical Study of the Questions and Answers Posted on the Online Q & A Communities in Toxic Gelatin Event.....	<i>Gang Li, Jinghao Chen</i>	303

Part 3 Semantic Information Organization and Retrieval

Application of Semantic Technology in Rational Use of Antibacterial Agents.....	<i>Siwei Yu, Lei Xu, Zhisheng Huang</i>	315
Based on User Information Mining of E-government Information Resource Organization.....	<i>Lixin Xia, Shanshan Zhai, Xiufeng Cheng</i>	321
Chinese Grammar Correction Method and System Based on XML Syntax Rules.....	<i>Yigang Zhou, Yiyao Liang, Luyao Huang, et al</i>	327
Context-aware Recommendation Using Item-Based Collaborative Filtering Technology.....	<i>Xueqing Tan, Shan He, Pan Pan</i>	333
LiterMiner: A Novel Analytic System for Heterogeneous Literature Data.....	<i>Lianlong Shao, Mu Yin</i>	338
Study on Technical Novelty Retrieval Assistant.....	<i>Jianmin Yao, Chuan Ge, Hongmei Chen</i>	344
Research and Analysis on the Author Name Disambiguation of Literature Data.....	<i>Chuan Ge, Jianmin Yao, Yufeng Wang</i>	349
Research on Descriptions of Digital Objects for Mass Digitalization Projects Based on Entity Relationship Model.....	<i>Linlin Song, Han Liu</i>	355
Research on the Method of Chinese UGC-oriented Ontology Concept Extraction.....	<i>Hua Hu</i>	364
Solution of Fine-grained Knowledge Organization and Aggregation for Information Resources of Science and Technology in the Era of Big Data.....	<i>Cuichang Ma, Junfeng Situ, Shujin Cao</i>	372
Study on Chinese Historical Records Analysis Based on Semantic System: Historical Records Knowledge Model.....	<i>Fei Wang, Dong Hui, Fan Hao</i>	378
Study on Lexicon Construction for Query Expansion in Natural Language Document Retrieval.....	<i>Hongmei Chen, Siyong Xiong, Jianmin Yao</i>	383
Study on Semantic Analysis Architecture of Chinese Historical Records.....	<i>Hui Dong, Lei Xu</i>	387
Study on Semantic Reasoning Mechanism of Chinese Historical Records.....	<i>Lei Xu, Hui Dong</i>	394
The Application of Query Performance Prediction to Result Merging of Aggregated Search.....	<i>Rui Meng, Yong Huang, Qi Wang, et al</i>	401
The Developing Change of Concept Category and Classification Method in the Thesaurus Establishment.....	<i>Panpan Deng, Chun Chang</i>	407
The Method and Application of Context Modeling Based on Components.....	<i>Fenglin Li, Zhazhan Mao</i>	413
User's Preference Modeling Based on the Improved Relation Community Discovering.....	<i>Jiming Hu, Ruhua Huang</i>	418

The background of the page is a light gray abstract composition. It features a large, faint globe in the upper left quadrant. In the lower left, there is a laptop with a screen displaying a grid pattern. Scattered across the lower half are various elements including binary code (0s and 1s), a network diagram with nodes and lines, and a faint image of a person's head in profile. The overall aesthetic is technological and modern.

Abstract—This article examines the three key properties of science and technology resource as a kind of knowledge and also a typical item of public goods and some socially effective mechanisms to maximize the value of these resources. In particular, we emphasize government's role in the sharing system of S&T resources.

Keywords—science and technology resource; public goods; government's role

I. THREE KEY PROPERTIES

In a broad way, science and technology resources include all material, people, and information and so on that are associated with science or technology in society. Typically, science and technology resource is classified into four main kinds: human resources, financial resources, material resources and information resources. In this article we pay main attention to the knowledge behind these kinds of resources like scientific literature, high-tech equipment, scientific data, natural resources, experiment base and professional techniques. In this way, we can clearly see that these scientific and technology resources are of some similar properties to public goods—nonexcludability, nonrivalry and cumulativeness.

A. Nonexcludability

Science and technology resource is a nonexcludable public good, and it is difficult to make it excludable or to control it privately. It is a fluid and portable good. Of course, science and technology resource can be kept secret with a granted patent, for example, yet as soon as it is revealed it slips out of one's grasp. In that respect, it is

a good that differs from jewels that one wears.

Science and technology resource continuously spillover from the entities producing them, and can thus be used freely by rivals, which is also called “positive externalities” if the impact on third parties is positive. Science and technology resource can leak out in multiple ways and the spillover can be very fast. For example, information on R&D decisions is known to rivals within six months, while technical details are known within a year. As we know, however, the harnessing of knowledge by other firms also depends on their learning capacity.

B. Nonrivalry

The nonrivalry of science and technology resource derives from its inexhaustibility, because the use of existing resource by an additional party does not imply the production of an additional copy of that resource. The innovator does not have to produce an additional unit of knowledge every time it's used. It is a nonrival good insofar as people do not have to compete for its use. Thus, the transmitting of knowledge is a positive sum game that multiplies the number of owners of that resource indefinitely (as opposed to transmitting an item of commodity which is a zero-sum game). Some researchers also use term “infinite expansibility” to denote “nonrivalry”. Since the marginal cost is nil, economics cannot comply with the rules of cost-based pricing. According to those rules, the use of science and technology resource is free, and it would be impossible to compensate financially for the fact that an item of science and technology resource is used many times.

C. Cumulativeness

Science and technology resource is cumulative and progressive since it is an intellectual input possible to spawn new ideas and new goods. This means that externalities not only enhance consumers' enjoyment but also, and above all, promote the accumulation of science and technology and collective progress; it is the possibility for some to "stand on the shoulders of giants." In other words, what spreads and can be used an infinite number of times is not only a consumer good (for instance, an item of equipment) but essentially an intellectual input likely to spawn new goods that will also be usable for infinite times. In an era of rapid technological progress, many types of knowledge are strongly cumulative, such as computer technology, intelligence techniques and patent. These stand in contrast with noncumulative ones, such as experimental facilities.

II. ISSUES REGARDING VALUE

It is the nonexcludability, nonrivalry and cumulativeness threesome that is at the origin of the huge size of the potential spillovers associated with the production of science and technology resources. Value of such resources is maximized in the process of transmitting and sharing, which is the weak chain of market mechanism. Thus, a sharing system of science and technology resources is needed to be launched by government.

A. Value in Science and Technology

The multiple forms of value in science and technology resources lie in its essence as capitals, commodity and scarcity of resources.

With the development of society and economics, the demand for science and technology resources is growing strongly in various industries. Not only are a large number of science and technology resources required but also higher-tech ones are needed. However, the progress of science and technology has a long way to go. In contrast, the reality is tough especially in rapidly developing countries such as China. For the majority of industries, development methods should be changed from the traditional one that depends heavily upon human and resources advantages to what is more efficient, economical and environment-friendly. In order to achieve this kind of transformation, a wide range of science and

technology resources are necessary. However, the lack in education and innovation support leads to the shortage of these resources in various fields. In this circumstance, the value of science and technology resources is extremely high. Meanwhile, the uneven allocation and asymmetric information of these resources makes them "scarcer" in some areas.

Science and technology resource is a kind of capital since it is fluid and can bring in the increase in value probably more than the value of itself. The value of this sort of resource is achieved in the process of production, transformation, utilization and allocation.

From the standpoint of commodity, we know that science and technology resources have huge value in a range of industries, and the value can be different to different entities or individuals with different capabilities. Its production is motivated by the demand of it. The value of these resources is achieved in the process of trading.

From these three aspects above, it is obvious that the value of science and technology resources is presented in the progress of transforming and sharing. In other word, the flow of science and technology is also a flow of value and increase of value. Its value is the motivation of the allocation and sharing, so much has to be done in these two vital steps to realize the maximum value of these resources.

B. Realization Process of Its Value

Value in science and technology resources is realized in the form of fluxion. However, the amount of realized value in the same resource varies greatly among different entities and individuals who own and utilize them. Thus science and technology resource is an all-around one and only by using it in various areas by different entities or individuals in lots of forms can we achieve its most potential value and make it socially efficient.

In a specific chain of its management, the inner and potential value is fixed to some extent, but in current conditions we cannot realize its value sufficiently. With the complexity of science and technology and differentiation of its functions, the realization form and the value realized can be different. This point can be analyzed in horizontal and vertical aspects.
